**Vee-Go Grow™ plant and soil revitalizer is such a necessary, well developed and unique product that we believe it will become an industry staple. This is not just because it helps to clean up and rejuvenate the soil from the rigors of chemical fertilizers, herbicides, fungicides, pesticides, air pollution..., but because it increases harvests and productivity. The more feedback we get from farmers and growers of all types, the more excited we are to share it with more people. Below we have put together some photos and descriptions of Vee-Go Grow in use. We hope you will be really motivated to give it a try!**

*The key is trying the product yourself, but before that happens, you need some evidence that supports what we say. We hope that these photos and stories below will inspire confidence and motivate you to use Vee-Go Grow!*

## **Oat & Rye Fields**

Here is what happened the first year that a skeptical farmer in South Carolina used Vee-Go Grow™ on one of his cattle grazing fields. The fields are planted with a mixture of rye and oats.

In order to see for himself how our Vee-Go Grow™ product would benefit his operation, the farmer planted one of three grazing fields with Vee-Go Grow™. All three fields were planted on February 22, 2001. The test field was sprayed with the proper dosage of Vee-Go Grow™, while the other two fields were fertilized according to his usual procedure. A week later, the cattle were accidentally turned loose on the treated field. What grasses had started growing were grazed down to the ground before he could get the cattle onto another field. He was sure that the field was ruined and would have to be redone, but he left the field alone to see what would happen. The following photographs, taken on March 22, 2001, exactly 4 weeks after planting, tell the tale. The Vee-Go Grow™ treated field has far surpassed the growth of the untreated fields. The rye & oats are thick, dark green, and lush. There are no bare spots in the field, and no yellowed patches. The oats are already heading, and both the rye & oats are nearly two feet tall. The fields in which the usual fertilizers were used are less than one foot tall, with bare and yellowed patches throughout.

This is a testimony that shows how Vee-Go Grow™ will help to grow healthy lush fields for cattle to graze in as little as 4 weeks. This greatly enhanced the farmers operation by keeping fresh feed available for his cattle and greatly reducing the need to purchase hay from outside sources while waiting for his fields to ripen.

I am just thinking that if I were a cow, I would really like to eat from the treated field!

G-17

What happened is that the cattle grazed out the weedy, rough untreated field in only a couple weeks. They had leg sores and cuts from the weeds... They next went to the lush and thick grasses in the Vee-Go Grow™ field. The cattle couldn't keep up with the rich growth, and ended up staying there for 2 ½ months - healthy and happy as can be! ↙
